BUSI · FOR SAP BUSINESS ONE

# The AI-first client for SAP Business One.

Control your system through the AI assistant, in your own words. Shaped to how you work, and changing as your processes change, without waiting for a developer or consultant.

## THREE PROBLEMS

### Trapped in the desktop client
Years of logic locked in the client and its add-ons. Every change waits for a developer.

### Agents outside SAP
Companies build agents and use AI beside SAP: silos, leaks and no oversight.

### No safe way to write
Probabilistic agents, a deterministic ledger. A yes in a chat window is not control.

## THREE ANSWERS

### An AI-first client
Everything the SAP client does, on pages like SAP's own forms, web and mobile. The logic in plain language.

### A connector in your own assistant
Agents work inside SAP, as the person, under SAP's own authorizations. Knowledge kept and shared.

### The gate
Every change shown in SAP's form, approved by a person, a passkey when money moves. On record.

## WHAT YOU CAN DO

### Ask, and it's prepared
Ask what's late, what's short or what to fix. Busi answers from SAP and prepares every step, ready to approve.

### Complex work, made easy
Hours of clicking become one request: a chain of documents, or hundreds of records, approved at once.

### Undo and redo
Rewind a wrong chain and run it again, step by step. A record goes back only if nobody else changed it.

### Customize by asking
Workflows, user-defined fields, queries and business rules, set up and changed through the prompt, in your own language.

### Extend SAP
Production, service and project management, built in. What used to need separate add-ons, in one place.

### Company skills
Agent skills for the whole company: a task done well is saved as a reusable skill, shared with the right SAP user groups.

## SAFE BY DESIGN

- The agent never writes. You approve the change.
- Everything runs as you, under SAP's own rights.
- Money and rights take a passkey, not a click.
- Every read is logged and every change is on record.

## GETTING STARTED

- Nothing to install: one connector per company.
- Business logic and print layouts carried over.
- Start on a copy of live, then go live step by step.
- Fixed implementation, a base fee, a seat per user.

**Agents do the work. People approve. Business One stays the record.**
